

INTEGRATED WIRELESS AND WIRELINE BILLING AND SERVICES MANAGEMENT

ABSTRACT

5 Methods and systems are provided for integrating billing and services
management systems across disparate telecommunications systems including wireless
systems and local and long distance wireline systems. Wireless and wireline services
may be charged to and billed under one periodic billing. A rollover management system
is employed for managing units of call usage that may be "rolled over" from a present
10 usage period to a subsequent usage period. An integrated services settlement system is
provided which is operable for apportioning revenue associated with utilization of the
wireless carrier's services to the wireless carrier and for apportioning revenue associated
with the wireline carrier's services to the wireline carrier. An integrated
telecommunications services ordering system is provided that is operable to synchronize
15 subscriber orders between the subscriber's wireless and wireline carriers.
